## **ASSAB 8407 Supreme**

ASSAB 8407 Supreme can be regarded as an "all-round" steel used in several application areas. Except for hot work application areas the steel is also used in moulds for plastics and as a material in high stressed axles.

The high degree of purity and the very fine structure shows improvement in dies and components where high mechanical and thermal stresses are involved.

## **GENERAL**

ASSAB 8407 Supreme is a chromium-molybdenum-vanadium-alloyed steel which is characterised by:

- High level of resistance to thermal shock and thermal fatigue
- Good high-temperature strength
- Excellent toughness and ductility in all directions
- Good machinability and polishability
- Excellent through-hardening properties
- Good dimensional stability during hardening

Typical analysis %	С	Si	Mn	Cr	Мо	٧
Typical analysis 70	0.39	1.0	0.4	5.2	1.4	0.9
Standard specification	Premiu	ım AISI	H13, W	/Nr. 1.2	2344	
Delivery condition	Soft ar	nealed	to appr	ox. 180	НВ	
Colour code	Orang	е				

### **IMPROVED TOOLING PERFORMANCE**

The name "Supreme" implies that by special processing techniques and close control, the steel attains high purity and a very fine structure.

Further, ASSAB 8407 Supreme shows significant improvements in isotropic properties compared to conventionally produced AISI H 13 grades.

These improved isotropic properties are particularly valuable for tooling subjected to high mechanical and thermal fatigue stresses, e.g. die casting dies, forging tools and extrusion tooling. In practical terms, tools may be used at somewhat higher working hardnesses (+1 to 2 HRC) without loss of toughness. Since increased hardness slows down the formation of heat checking cracks, improved tool performance can be expected.

ASSAB 8407 Supreme meets the North American Die Casting Association (NADCA) #207-2011 for premium high quality H-13 die steel.

## **APPLICATIONS**

## **TOOLS FOR DIE CASTING**

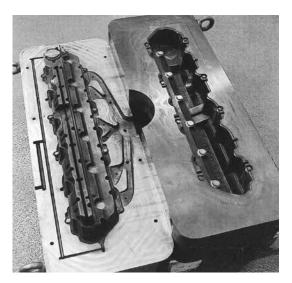

Part	Tin, lead zinc alloys HRC	Aluminium, magnesium alloys, HRC	Copper alloys HRC
Dies	46 - 50	42 - 48	QRO 90 Supreme
Fixed inserts cores	46 - 52	44 - 48	QRO 90 Supreme
Sprue parts	48 - 52	46 - 48	QRO 90 Supreme
Nozzles	35 - 42	42 - 48	QRO 90 Supreme
Ejector pins (nitrided)	46 - 50	46 - 50	46 - 50
Pluner, shot sleeve (normally nitrided)	42 - 46	42 - 48	QRO 90 Supreme
Austenitising temperature	1020 - 1030 °C		1040 - 1050 °C

## **TOOLS FOR EXTRUSION**

Part	Aluminium magnesium alloys, HRC	Copper alloys HRC	Stainless steel HRC
Dies	44 - 50	43 - 47	45 - 50
Backers, die-holders, liners, dummy blocks, stems	41 - 50	40 - 48	40 - 48
Austenitising temperature (approx.)	1020 - 1030 °C	1040 - 1	1050 °C

## **TOOLS FOR HOT PRESSING**

Material	Aust. temp (approx.) °C	HRC
Aluminium,	1020 - 1030	44 - 52
magnesium Copper alloys	1040 - 1050	44 - 52
Steel	1040 - 1050	40 - 50

## **MOULDS FOR PLASTICS**

Part	Austenitising temp	HRC
Injection moulds	1020 - 1030 °C	
Compression/ transfer moulds	Tempering 1. ≥550 °C or 2. 250 °C	40 - 52 50 - 53

## **OTHER APPLICATIONS**

Application	Austenitising temp	HRC
Severe cold punching scrap shears	. 1020 - 1030 °C Tempering 250 °C	50 - 53
Hot shearing	1020 - 1030 °C Tempering 1. 250 °C or 2. 575-600 °C	50 - 53 45 - 50
Shrink rings (e.g. for cemented carbide dies)	1020 - 1030 °C Tempering 575 - 600 °C	45 - 50
Wear resisting parts	1020 - 1030 °C Tempering 575 °C Nitriding	Core 50 - 52 Surface ~1000 HV <sub>1</sub>

## **PROPERTIES**

All specimens are taken from the centre of a  $407 \times 127$ mm bar. Unless otherwise is indicated all specimens were hardened 30 minutes at 1025 °C, quenched in air and tempered 2 + 2 h at 610 °C. The hardness were 45 ± 1 HRC.

## **PHYSICAL DATA**

Data at room and elevated temperatures.

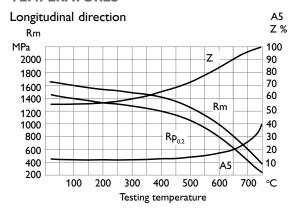

Temperature	20 ℃	400 °C	600 °C
Density kg/m³	7 800	7 700	7 600
Modulus of elasticity MPa	210 000	180 000	140 000
Coefficient of thermal expansion per °C from 20 °C	-	12.6 × 10 <sup>-6</sup>	13.2 × 10 <sup>-6</sup>
Thermal conductivity W/m°C	25	29	30

## **MECHANICAL PROPERTIES**

Approximate tensile strength at room temperature.

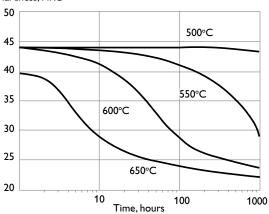

Hardness	52 HRC	45 HRC
Tensile strength Rm	1 820 MPa	1 420 MPa
Yield strength Rp <sub>0.2</sub>	1 520 MPa	1 280 MPa

## **APPROXIMATE STRENGTH AT ELEVATED TEMPERATURES**

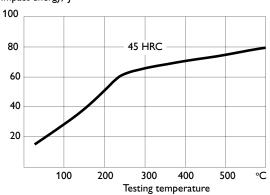

## **EFFECT OF TIME AT HIGH TEMPERATURES ON HARDNESS**

Hardness, HRC

## **EFFECT OF TESTING TEMPERATURE ON IMPACT ENERGY**

Charpy V specimens, short transverse direction Impact energy, J

## **HEAT TREATMENT**

## **SOFT ANNEALING**

Protect the steel and heat through to 850  $^{\circ}$ C. Then cool in furnace at 10  $^{\circ}$ C per hour to 650  $^{\circ}$ C, then freely in air.

### **STRESS RELIEVING**

After rough machining the tool should be heated through to  $650\,^{\circ}$ C, holding time 2 hours. Cool slowly to  $500\,^{\circ}$ C, then freely in air.

## **HARDENING**

Preheating temperature:  $600 - 850 \,^{\circ}$ C, normally in two pre-heating steps.

Austenitising temperature: 1020 - 1050 °C, normally 1020 - 1030 °C.

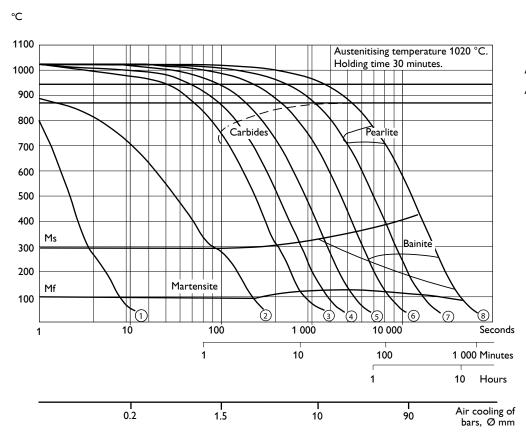

Temperature °C	Soaking time* minutes	Hardness before tempering HRC
1025	30	53±2
1050	15	54±2

<sup>\*</sup> Soaking time = time at hardening temperature after the tool is fully heated through

Protect the part against decarburisation and oxidation during hardening.

### **CCT-GRAPH**

Austenitising temperature 1020 °C. Holding time 30 minutes.

A <sub>C1f</sub> =	950	°C
A <sub>C1s</sub> =	870	°C

Cooling Curve No.	Hardness HV 10	T <sub>800-500</sub>
1	681	1
2	620	37
3	606	160
4	601	280
5	585	560
6	560	1 390
7	537	3 220
8	473	8 360

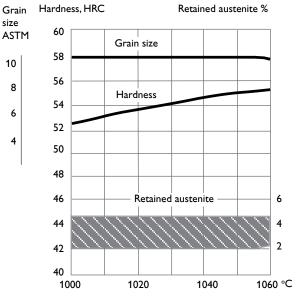

## **QUENCHING MEDIA**

- High speed gas/circulating atmosphere
- Vacuum (high speed gas with sufficient positive pressure). An interrupted quench is recommended where distortion control and quench cracking are a concern
- Martempering bath or fluidised bed at 450 550°C then cool in air
- Martempering bath or fluidised bed at approx. 180-220°C then cool in air
- Warm oil

Note 1: Temper the tool as soon as its temperature reaches 50 - 70°C.

Note 2: In order to obtain the optimum properties for the tool, the cooling rate should be fast, but not at a level that gives excessive distortion or cracks.

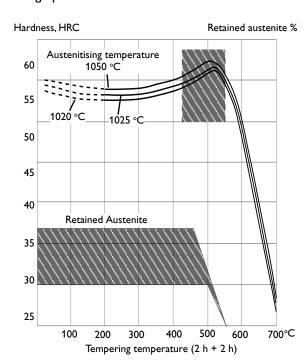

## HARDNESS, GRAIN SIZE AND RETAINED **AUSTENITE AS FUNCTIONS OF AUSTENITISING TEMPERATURE**

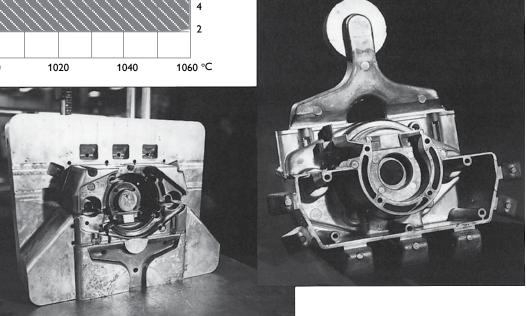

#### **TEMPERING**

Choose the tempering temperature according to the hardness required by reference to the tempering graph. Temper minimum twice with intermediate cooling to room temperature.

Lowest tempering temperature 250 °C. Holding time at temperature minimum 2 hours. To avoid "temper brittleness", do not temper in the range 425 - 550 °C, see graph.

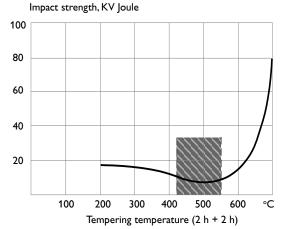

Above tempering curves are obtained after heat treatment of samples with a size of  $15 \times 15 \times 40$  mm, cooling in forced air. Lower hardness can be expected after heat treatment of tools and dies due to factors like actual tool size and heat treatment parameters.

## APPROXIMATE IMPACT STRENGTH AT DIFFERENT TEMPERING TEMPERATURES

## Charpy V specimens, short transverse direction.

Tempering within the range  $425-550\,^{\circ}\text{C}$  is normally not recommended due to the reduction in toughness properties avoided.

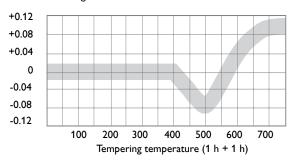

## DIMENSIONAL CHANGES DURING HARDENING

Sample plate, 100 x 100 x 25 mm

		Width %	Length %	Thickness %
Oil hardened from	Min	-0.08	-0.06	±0
1020 °C	Max	-0.15	-0.16	+0.30
Air hardened from 1020 °C	Min	-0.02	-0.05	±0
	Max	+0.03	+0.02	+0.05
Vac hardened from 1020 °C	Min	+0.01	-0.02	+0.08
	Max	+0.02	-0.04	+0.12

## DIMENSIONAL CHANGES DURING TEMPERING

Dimensional change %

Note: The dimensional changes in hardening and tempering should be added.

### **NITRIDING AND NITROCARBURISING**

Nitriding and nitrocarburising result in a hard surface layer which is very resistant to wear and erosion. The nitrided layer is, however, brittle and may crack or spall when exposed to mechanical or thermal shock, the risk increasing with layer thickness. Before nitriding, the tool should be hardened and tempered at a temperature at least 25 – 50 °C above the nitriding temperature.

Nitriding in ammonia gas at 510  $^{\circ}$ C or plasma nitriding in a 75% hydrogen/25% nitrogen mixture at 480  $^{\circ}$ C both result in a surface hardness of about 1100 HV<sub>0.2</sub>.

In general, plasma nitriding is the preferred method because of better control over nitrogen potential; in particular, formation of the so called white layer, which is not recommended for hot-work service, can readily be avoided.

However, careful gas nitriding can give perfectly acceptable results.

ASSAB 8407 Supreme can also be nitrocarburised in either gas or salt bath. The surface hardness after nitrocarburising is  $900 - 1000 \text{ HV}_{0.2}$ .

#### **DEPTH OF NITRIDING**

Process	Time	Depth	
Trocess	тппе	mm	
Gas nitriding at 510 °C	10 h 30 h	0.12 0.20	
Plasma nitriding at 480 °C	10 h 30 h	0.12 0.18	
Nitrocarburising - in gas at 580 °C - in salt bath at 580 °C	2.5 h 1 h	0.11 0.06	

Nitriding to case depths >0.3 mm is not recommended for hot work applications.

ASSAB 8407 Supreme can be nitrided in the softannealed condition. The hardness and depth of case will, however, be reduced somewhat in this case.

## **MACHINING RECOMMENDATIONS**

The cutting data below are to be considered as guiding values, which must be adapted to existing local conditions.

## **TURNING**

Cutting data	Turning w	Turning with high	
parameters	Rough turning	Fine turning	speed steel Fine turning
Cutting speed (v <sub>C</sub> ), m/min	200 – 250	250 – 300	25-30
Feed (f) mm/rev	0.2 – 0.4	0.05 - 0.2	0.05-0.3
Depth of cut (a <sub>p</sub> ) mm	2 - 4	0.5 – 2	0.5 – 2
Carbide designation ISO	P20 – P30 Coated carbide	P10 Coated carbide or cermet	-

## **DRILLING**

## **HIGH SPEED STEEL TWIST DRILL**

Drill diameter mm	Cutting speed $(v_C)$ m/min	Feed (f) mm/r
≤ 5	16 – 18 *	0.05 – 0.15
5 – 10	16 – 18 *	0.15 – 0.20
10 – 15	16 – 18 *	0.20 - 0.25
15 – 20	16 – 18 *	0.25 - 0.35

<sup>\*</sup> For coated high speed steel drill  $V_c$  = 28 - 30 m/min

## **CARBIDE DRILL**

Cutting data	Type of drill		
parameters	Indexable insert	Solid carbide	Carbide tip <sup>1)</sup>
Cutting speed (v <sub>C</sub> ), m/min	220 – 240	130 – 160	80 – 110
Feed (f <sub>2</sub> ) mm/tooth	0.03 - 0.12 2)	0.08 - 0.20 3)	0.15 – 0.25 4)

<sup>&</sup>lt;sup>1</sup> Drill with replaceable or brazed carbide tip

## **MILLING**

## **FACE AND SQUARE SHOULDER MILLING**

Cutting data	Milling with carbide		
parameters	Rough milling	Fine milling	
Cutting speed (v <sub>c</sub> ) m/min	180 – 260	260 – 300	
Feed (f <sub>z</sub> ) mm/tooth	0.2 – 0.4	0.1 – 0.2	
Depth of cut (a <sub>p</sub> ) mm	2 – 5	≤ 2	
Carbide designation ISO	P20 – P40 Coated carbide	P10 – P20 Coated carbide or cermet	

## **END MILLING**

	Type of end mill		
Cutting data parameters	Solid carbide	Carbide indexable insert	High speed steel
Cutting speed (v <sub>c</sub> ) m/min	160 – 200	170 – 230	35 – 401)
Feed (f <sub>z</sub> ) mm/tooth	0.03 - 0.20 2)	0.08 – 0.20 <sup>2)</sup>	0.05 - 0.35 2)
Depth of cut (a <sub>p</sub> ) mm	-	P20, P30	-

<sup>&</sup>lt;sup>1)</sup> For coated high speed steel end mill Vc = 55 - 60 m/min

## **GRINDING**

A general grinding wheel recommendation is given below. More information can be found in the publication "Grinding of tool steel".

Type of grinding	Soft annealed	Hardened
Face grinding straight wheel	A 46 HV	A 46 HV
Face grinding segments	A 24 GV	A 36 GV
Cylindrical grinding	A 46 LV	A 60 KV
Internal grinding	A 46 JV	A 60 IV
Profile grinding	A 100 KV	A 120 KV

<sup>2</sup> Feed rate for drill diameter 20 – 40 mm

 $<sup>^3</sup>$  Feed rate for drill diameter 5-20 mm

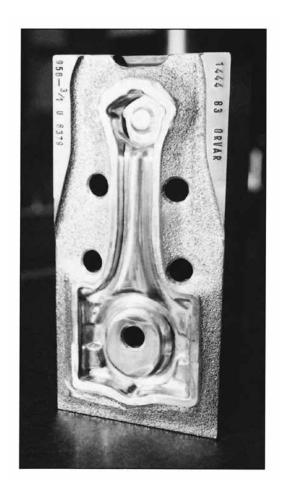

<sup>&</sup>lt;sup>4</sup> Feed rate for drill diameter 10 – 20 mm

<sup>&</sup>lt;sup>2)</sup> Depending on radial depth of cut and cutter diameter

## WELDING

Welding of tool steel can be performed with good results if proper precautions are taken regarding elevated temperature, joint preparation, choice of consumables and welding procedure.

Welding method	TIG	MMA
Working temperature	325 - 375 °C	325 - 375 °C
Welding consumables	QRO 90 TIG Weld DIEVAR TIG Weld	QRO 90 Weld
Cooling rate	20 - 40 °C/h the first 2 - 3 h then freely in air.	
Hardness after welding	50 - 55 HRC	50 - 55 HRC
Heat treatment after welding:		
Hardened condition	Temper at 10 - 20 °C original tempering ten	
Soft annealed condition	Soft-anneal the material at 850 °C in protected atmosphere. Then cool in the furnace at 10 °C per hour to 650 °C, then freely in air.	

## ELECTRICAL DISCHARGE MACHINING — EDM

If spark-erosion is performed in the hardened and tempered condition, the white re-cast layer should be removed mechanically e.g. by grinding or stoning. The tool should then be given an additional temper at approx. 25 °C below the previous tempering temperature.

## HARD CHROMIUM PLATING

After plating, parts should be tempered at 180 °C for 4 hours within 4 hours of plating to avoid the risk of hydrogen embrittlement.

## **POLISHING**

ASSAB 8407 Supreme has good polishability in the hardened and tempered condition because of a very homogeneous structure.

This coupled with a low level of non metallic inclusions, due to ESR process, ensures good surface finish after polishing.

Note: Each steel grade has an optimum polishing time which largely depends on hardness and polishing technique. Overpolishing can lead to a poor surface finish, "orange peel" or pitting.

## PHOTO-ETCHING

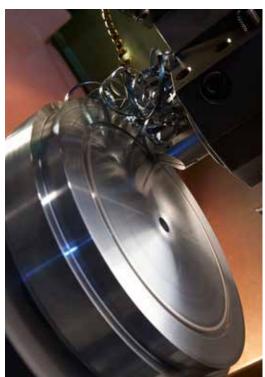

ASSAB 8407 Supreme is particularly suitable for texturing by the photo-etching method. Its high level of homogeneity and low sulphur content ensures accurate and consistent pattern reproduction.

## **FURTHER INFORMATION**

Please contact your local ASSAB office for further information on the selection, heat treatment, application and availability of ASSAB tool steel.

# **ASSAB**SUPERIOR TOOLING SOLUTIONS

## A ONE-STOP SHOP

alfelerum

ASSAB is unmatched as a one-stop product and service provider that offers superior tooling solutions. In addition to the supply of tool steel and other special steel, our range of comprehensive value-added services, such as machining, heat treatment and coating services, span the entire supply chain to ensure convenience, accountability and optimal usage of steel for customers. We are committed to achieving solutions for our customers, with a constant eye on time-to-market and total tooling economy.

Choosing the right steel is of vital importance. ASSAB engineers and metallurgists are always ready to assist you in your choice of the optimum steel grade and the best treatment for each application. ASSAB not only supplies steel products with superior quality, we offer state-of-the-art machining, heat treatment and surface treatment services to enhance steel properties to meet your requirement in the shortest lead time. Using a holistic approach as a one-stop solution provider, we are more than just another tool steel supplier.

ASSAB and Uddeholm are present on every continent. This ensures you that high quality tool steel and local support are available wherever you are. Together we secure our position as the world's leading supplier of tooling materials.

For more information, please visit www.assab.com
